

LET THE WORLD BE YOUR SCIENCE LAB

Seeking high school scientists, environmentalists, eco-innovators and problem-solvers who are up for a challenge

CIEE offers intensive experiential learning and scientific study programs in unique eco-systems and environments around the world. Students can gather data in Costa Rica, work in a marine lab in Spain, or survey wildlife in Botswana. With hands-on STEM opportunities on four different continents, we offer motivated students more ways than ever to investigate the natural world around them.

Bridging school-year and summer studies

CIEE's standards-aligned programs build on your high school curriculum, enhancing it with fieldwork and problem-solving in real-world settings. Students explore in-depth topics – from marine science to tropical biodiversity – connecting the dots from the classroom to the field and back to their home states and schools. They speak with NGO leaders about the impact of their work on local communities and gain scientific and technical skills working alongside experts in their fields.

Textbook concepts related to patterns, systems, and cause and effect take on new meaning out in the rivers or rainforest. Sustainability looks different in a mega city like Beijing than it does in the cloud forest of Costa Rica. Genuine challenges spark real questions and deeper understanding as students bridge their learning from high school classrooms to field work on the other side of the world.

Program highlights

Each weekly schedule balances lab time and field work with cultural excursions and activities to put the learning in context. Main components include:

- 3 hours a day of experiential learning with local experts in the lab or classroom and out on a field site. Students perform faculty-led research, test hypotheses, and explore essential questions about scientific concepts and conservation challenges.
- Daily cultural activities and outdoor experiences such as swimming, snorkeling, hiking, or canoeing.
- End-of-day reflections on complex topics like the influence of science, engineering and technology on society and the natural world. Based in their “living laboratory,” teens discuss big-picture issues like global biodiversity and sustainability, comparing what they see out in the field to their own backyards.

After an inspiring experience seeing science in action, students return to class energized the next fall, eager to jump into projects and to share their passion.

Seven three-week programs are offered this summer:

- Aquatic Ecosystems & Sustainability / Lisbon, Portugal
- Australian Wildlife Conservation / Perth, Australia
- Botswanan Wildlife Conservation / Gaborone, Botswana
- Building a Sustainable Mega City / Beijing, China
- Building a Sustainable Planet / Monteverde, Costa Rica
- Marine Science & Field Work / Palma de Mallorca, Spain
- Tropical Biodiversity Conservation / Monteverde, Costa Rica
